Evaluation of gustatory and olfactory function in pregnancy

Original title / Originaltitel
Olfaktorische und gustatorische Sensibilität in der Schwangerschaft

Summary / Zusammenfassung
The aim of the study was to evaluate gustatory and olfactory function in 53 pregnant women and 59 non-pregnant women by a validated olfactory and validated taste test.
In addition, we investigated whether nausea and vomiting and olfactory sensitivity are correlated.
We determined whether subjects with little or no nausea and vomiting are less sensitive to odours than subjects who indicate a high degree of nausea and vomiting, and whether subjects with relatively low olfactory sensitivity are less prone to nausea and vomiting than subjects with relatively higher olfactory sensitivity.
